## Features and general description 特点和一般介绍

DMF is a progressive modular distributor. It measures out and divides lubricant thanks to piston movement. DMF是一种递进式模块化分配器。由于活塞的运动，它能保证润滑油的排出和分配。

This system is highly qualified to measure out oil and grease for one or more support groups. 该系统是高度精密的计量油和油脂为一个或多个支持团体。

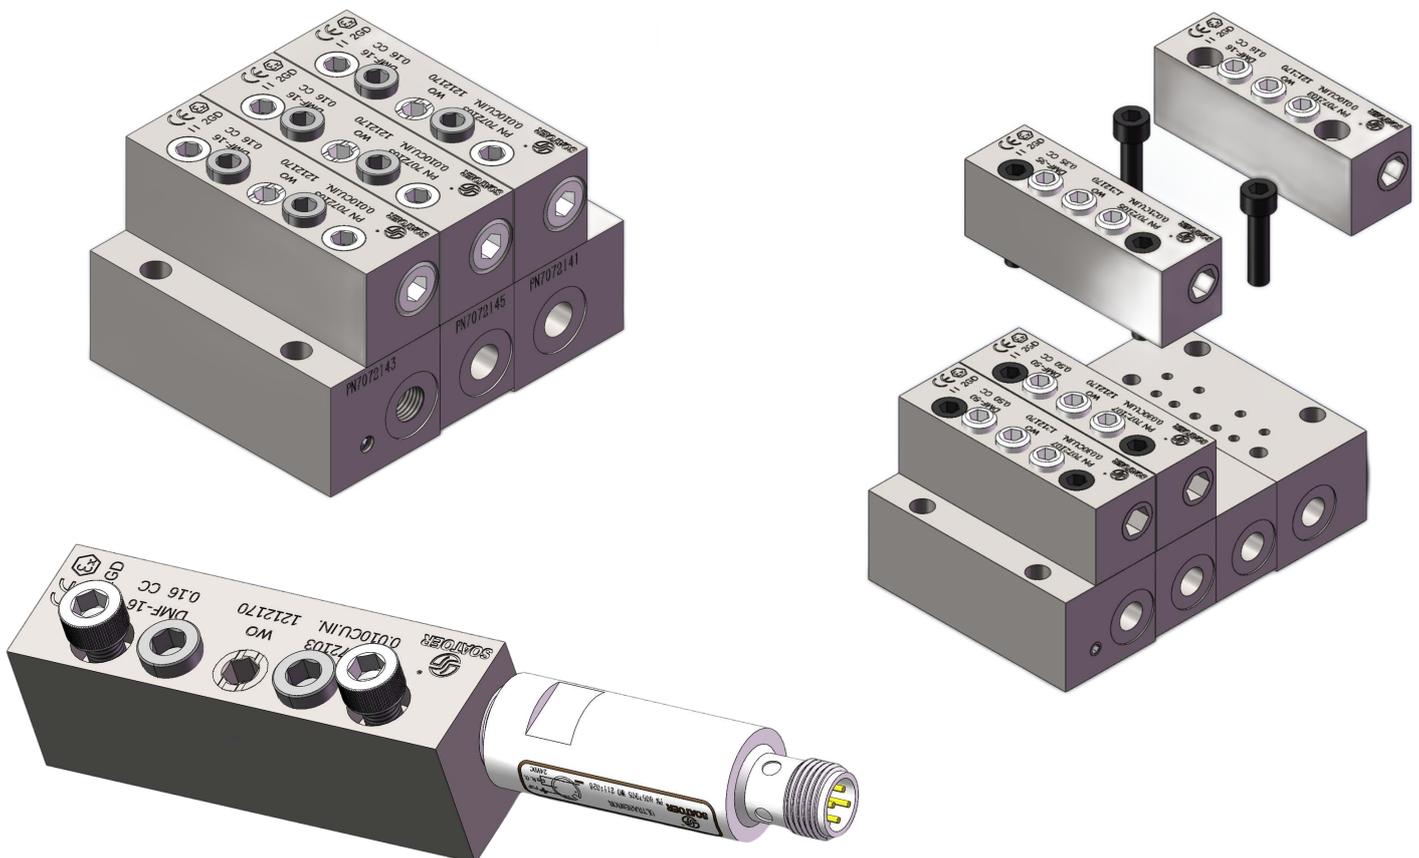

Every piston is in line with the previous one and the next one. When a piston fails to work, as for an external obstruction, the whole system stops (this happens even when we place a plug on a unused outlet). 每个活塞都与前一个和下一个在同一直线上。当活塞不能工作时，由于外部堵塞，整个系统停止工作(即使我们在一个未使用的出口上安装一个堵头，也会发生这种情况)。

A single control element is enough to check the functioning of the whole distribution system. 一个检测元件就足以检查整个分配器的运行。

The DMF modular system consists of two main parts: Base (divided into initial base, intermediate base and final base) and the Metering Elements (available in different outputs). DMF模块化系统主要由两部分组成：底座(分为入口底座、中间底座和末端底座)和计量元件(可提供不同的输出)。

The system can be easily extended and its modularity allows a low cost component replacement. 该系统可以很容易地扩展，其模块化允许低成本部件更换。

The assembled base can be installed and connected without Modular Metering elements to make easier the Tube tracking process. Metering elements can be installed later. 组装底座可以安装和连接，无需模块化计量元件，使管道跟踪过程更容易。计量元件可稍后安装。

## Assembly and components 集成和组件

The metering base is made of a serie of at least three elements: one initial base, an intermediate one and a final one. 计量底座由至少三个元素组成:一个初始底座, 一个中间底座和一个最终底座。

Thanks to a flexible and easy assembling process, the intermediate bases can be increased later to a maximum of 18. We can always add modules using the fixing bushes supplied with the assembly.

由于组装工艺灵活方便, 后中间基可增加到最多18个。我们总是可以使用组件提供的固定套筒添加模块。

The system can operate ad high pressures without lubricant loss between elements.该系统可以在高压下运行, 元件之间没有润滑剂损失。

## Supersensor control 超级传感器

Ultrasensor was designed to replace systems with inductive proximity sensors, mechanical micro-switches, and the magnetic contacts that monitor the movement of the Pistons inside the divider elements of progressive systems.

The sensor is a screw-on accessory (laterally to the divider), without needing to make any modifications to the divider.

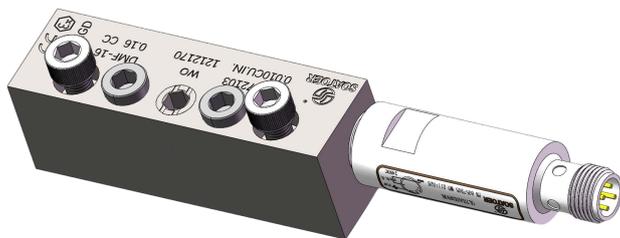

This patented technology allows you to check the variations in magnetic flow when the piston reaches the detection zone thanks to a Hall-Effect sensor. There are no moving parts providing for a complete absence of wear.

Ultrasensor的设计是为了用感应式接近传感器、机械微开关和磁性触点来取代现有的系统，这些触点可以监测渐进式系统中分压器内部活塞的运动。

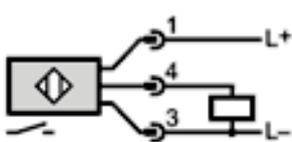

传感器是一个拧上附件(横向到分压器)，无需对分压器做任何修改。

这项专利技术通过霍尔效应传感器，当活塞到达探测区域时，可以检测磁流量的变化。

没有运动部件，完全没有磨损。

**Cooling and retaining action** 冷却和保持动作

The continuous supply of a mixed air stream, besides lubricating, it has also a cooling effect. The over-pressure inside the lubricated element, prevents the ingress of foreign bodies. prevent the access of foreign body.

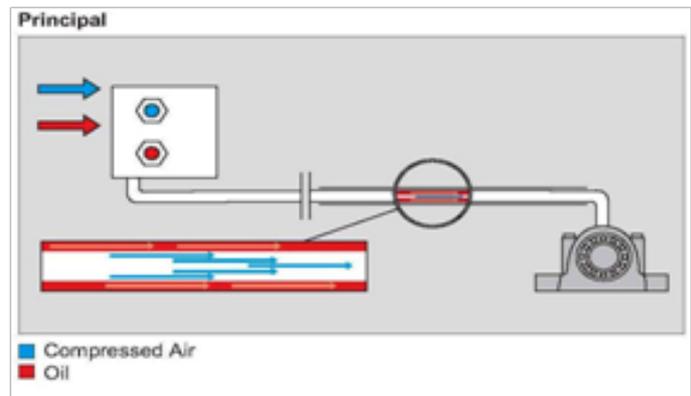

混合气流的连续供应，除了润滑外，还具有冷却作用。润滑元件内部的超压，防止异物进入。防止异物进入。

The air-oil system does not produce oil mist and therefore does not produce fogging. The constant air flux helps lubricant advancement along the internal walls. When the lubricant reaches the final point is spread in particles.油气系统不会产生油雾，因此不会产生雾。恒定的空气流量有助于润滑油沿内壁前进。当润滑剂到达最后一点时，就会扩散成颗粒。

**Functioning control** 功能控制

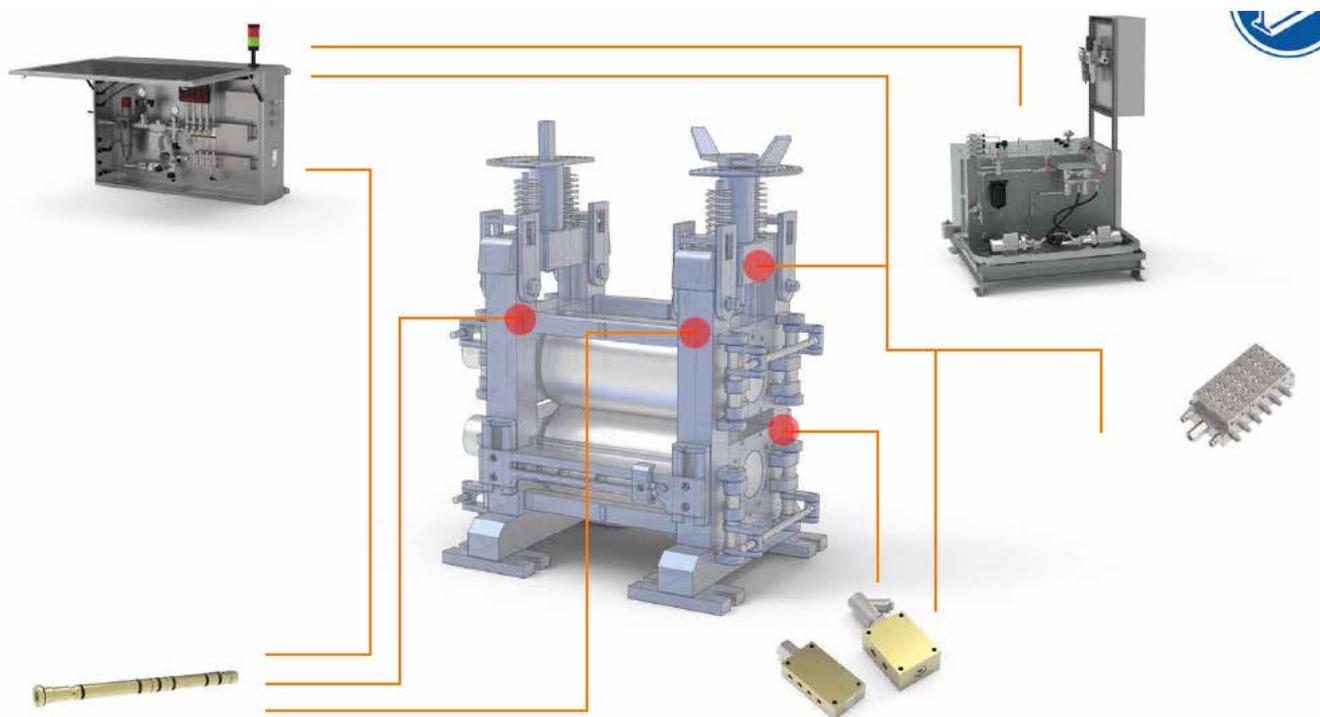

Thanks to the progressive system, the malfunctioning of a metering element is reported by a control device.

由于是递进系统，计量元件的故障由传感器发出信号。

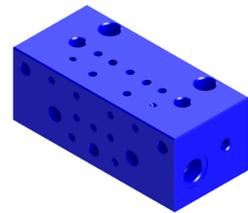

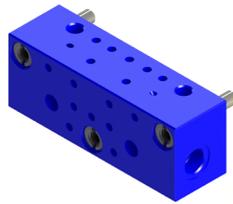

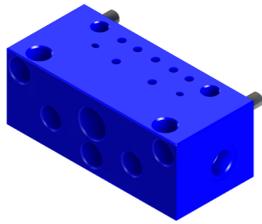

## Application fields 应用领域

- Lubrication of high speed rotating elements. Due to high centrifuge power, the lubricating film between the elements is carried off, so a constant distribution of small quantities of lubricant is required.  
高速旋转元件的润滑。由于离心功率高，元件之间的润滑膜被剥离，因此需要不断分布少量润滑油。
- Lubrication of machinery parts working at high temperatures where the lubricant tends to be dried or burned. 在高温下工作的机械部件的润滑，在高温下润滑剂容易干燥或燃烧。
- Spray lubrication of chains or gears. 链条或齿轮喷油润滑。
- Lubrication of slides and ways which require a thin film of lubricant all over their surface.  
需要在滑块表面涂上一层薄薄的润滑剂的滑轨和方法的润滑。
- Lubrication of bearings which need protection for dust infiltration, water or other damaging substances. The mixed air flow creates a slight over pressure inside the lubricated element, preventing the intrusion of other polluted bodies.  
需要防止灰尘渗入、水或其他有害物质的轴承润滑。混合的气流在润滑元件内部产生轻微的过压，防止其他污染物体的侵入
- Lubrication of point which cannot be reached by traditional lubrication system, where only an oil spray can solve the problem.  
润滑点，这是传统润滑系统无法达到的，在那里只有一个油喷雾一个解决问题。

## Connections 连接

in addition to the lubricant inlet configuration the DMFA has two inlets for the air supply. All the threads are 1/8 BSP.  
除了润滑油入口配置，DMFA有两个空气供应入口。所有螺纹均为1/8 BSP

The two pneumatic lines respectively supply the right and left side outlets of the distributor. The supply of both in not required.

As shown in the picture below, the operating pressure in the lubricant line must not exceed 100 bar.  
这两条气动管路分别供给分配器的左右出风口。两者的供应都是不需要的。  
如下图所示，润滑管路中的工作压力不得超过100bar。

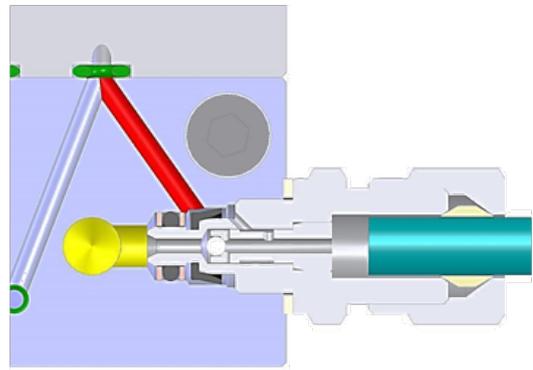

It is important to order specific outlet fittings both for a mixed output and a oil one. The two fitting models are supplied with a check valve to separates the two flows up the pipe and to prevent any backflow of lu-bricant in the pneumatic line.  
重要的是，为混合输出和石油输出订购特定的出口配件。这两种型号的配件都配有一个止回阀，以分离管道上的两种流体，并防止气动管路中的润滑油回流。

## DMFA element air consumption DMFA分配器耗气量

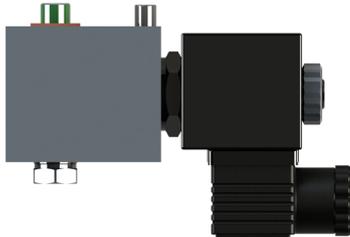

The Normal liter/hour air consumption depends on applid pressure, users number and point connection tube diameter (be careful in case of spray, nozzle diameter must be kept into account).正常升/小时的空气消耗量取决于施加压力、用户数量和点连接管直径(以防喷雾时要小心，喷嘴直径必须考虑在内)。

The maximum lubricant-line working pressure must not exceed 100 bar.

In **air-oil** systems the single or grouped metering valves selection is even more important.

在气-油系统中，单个或组合计量阀的选择甚至更为重要。

In some common application field as for Siderurgi-cal Facilities, EV-2 valves are required due to circuit length or the needing for system section exclusion.

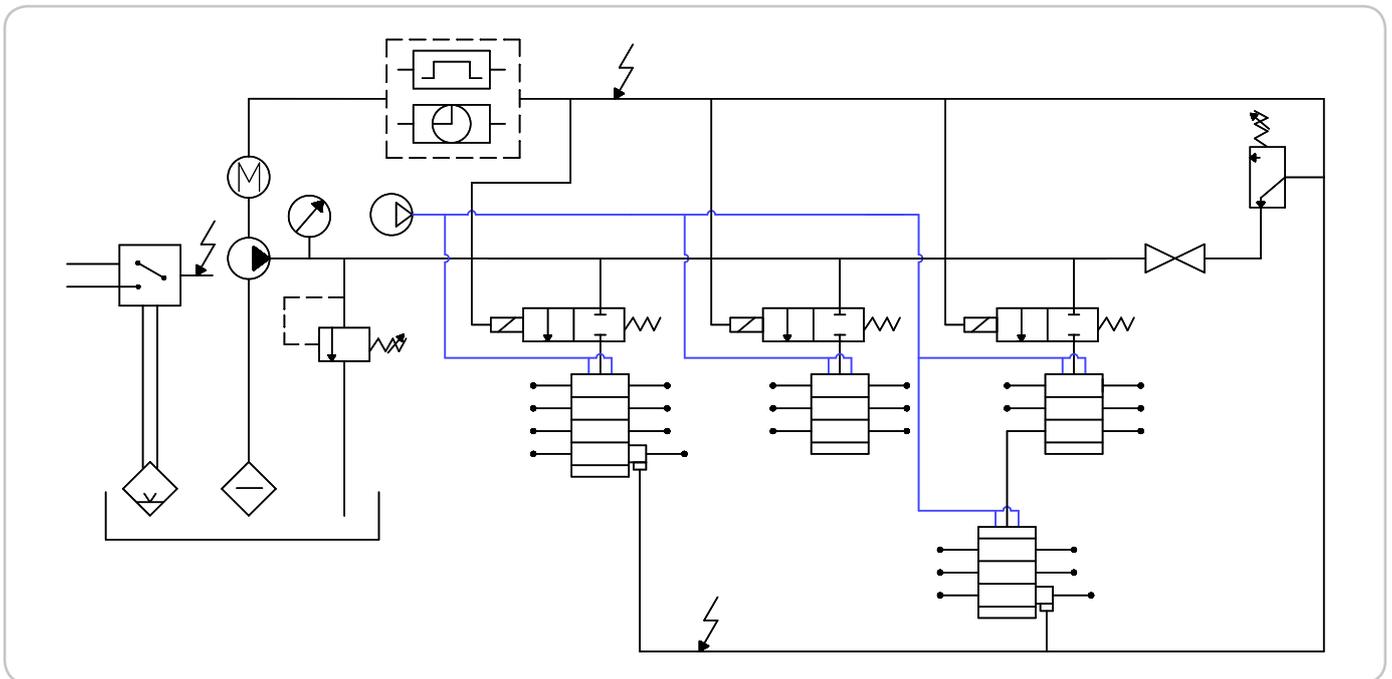

在一些常见的应用领域，如锡德里克设施，由于管路长度或需要系统部分控制，EV-2阀门是必需的。

**Attention:** To determine the outlets, take note that the assembly is seen vertically and the outlets are numbered sequentially starting from the top (inlet) from left to right.

A letter, a number or another letter is stamped on each divider element to indicate: 1) series, 2) capacity for each cycle, 3) outlet. The elements in the image are from the DMF series that have the following main characteristics:

1st input element: DMF08 with 2 outlets with a flow rate of 0.08 cm<sup>3</sup>/min each;

The 2nd element is the DMF25 LR which signifies a double right and left bridge for transfer to the subsequent element +0.16 cm<sup>3</sup>/min flow rate for each outlet;

The 3rd element is the DMF25 CC with two outlets with a flow rate of 0.25 cm<sup>3</sup>/min and a Supersensor NO on the right .

注意:要确定出口, 请注意总成是垂直的, 出口是按顺序从顶部(进口)从左到右编号的。

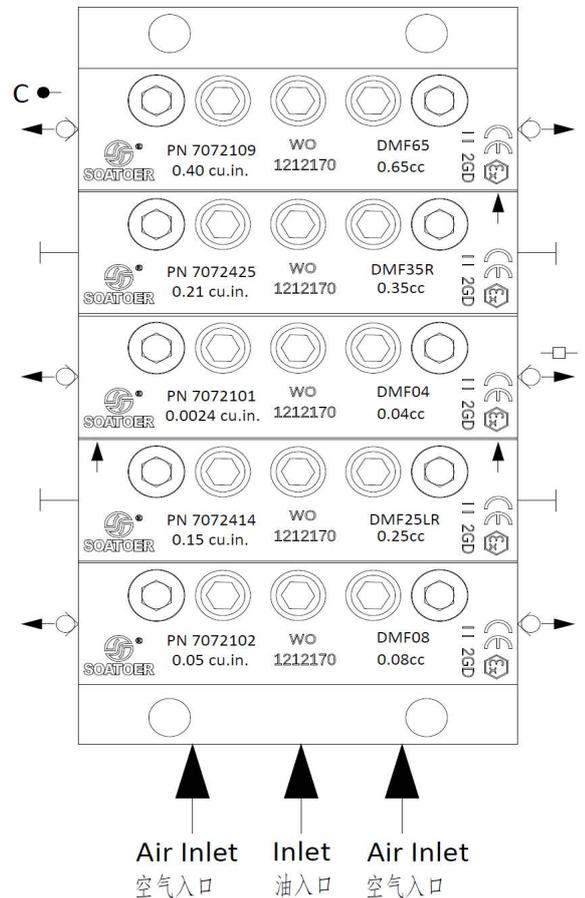

一个字母, 一个数字或另一个字母被印在每个计量元件上, 以表示: 系列, 2)每个循环的容量, 3)出口。

图像中的元素来自DMF系列, 具有以下主要特征:

第一个输入元件:DMF 08, 有2个出口, 每个出口的流量为0.08 cm<sup>3</sup>/min;

第二个元件是DMF25 LR, 表示一个双左右桥, 用于转移到后续元件, 每个出口的流量+0.25 cm<sup>3</sup>/min;

第三个元件是DMF25cc, 有两个出口, 流速0.25 cm<sup>3</sup>/min和一个超级传感器NO在右边
